

How well *do* you see?

20/20 VISION DOES NOT NECESSARILY MEAN PERFECT VISION.¹

A person's eyes – and their eye health – are constantly changing. At Alcon, our goal is to help everyone have the best vision possible during every stage in life. Learn more about your eye health by finding out what conditions can affect eyesight and vision, depending on your age.

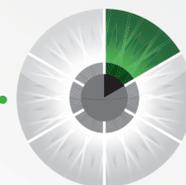

Your Eyes at Every Stage in Life.

Ages 60 and older

Age-related conditions, such as cataracts, may be treated with the right care to allow you to continue living a life of good vision. As people get older, they're more likely to get certain eye diseases and conditions.

- Cataracts
- Age-related Macular Degeneration (AMD)
- Diabetic Retinopathy
- Glaucoma
- Retinal Detachment
- Dry Eye
- Inflammation
- Eye Infection

Infants, Ages 3 and Younger

Overall eye health can have lifelong consequences in how babies and infants learn to see. That's why it's crucial to have the best care possible for common - and uncommon - eye diseases and conditions.

- Uncommon Eye Conditions
- Eye Infection

Children, Ages 4 to 12

Children's vision can frequently change, and regular eye care can help treat many of the common eye conditions that appear and can be diagnosed at this age.

- Eye Infection
- Refractive Errors
- Amblyopia and Strabismus
- Ocular Allergies

Ages 40 to 59

The possibility of being diagnosed with an eye condition, such as presbyopia, becomes more prevalent, while overall eye health starts to face new challenges between the ages of 40 to 59.

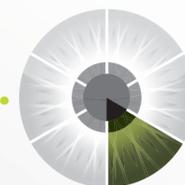

- Inflammation
- Diabetic Retinopathy
- Dry Eye
- Refractive Errors, including Presbyopia
- Glaucoma
- Ocular Allergies
- Retinal Detachment
- Eye Infection

Ages 20 to 39

The eye completes its growth in the early 20s, and contact lenses and glasses provide excellent vision correction during this time. Surgical approaches are also an option once refractive error stabilizes. Although many at this age experience healthy vision, there are some conditions that can still affect a person's overall eye health.

- Dry Eye
- Eye Infection
- Refractive Errors
- Ocular Allergies

Teenagers

It's important to realize that a teen's vision is still changing and this continues until their early 20s. Like younger children, teens are also susceptible to various eye conditions. Many teens also may start wearing contact lenses, which are often a successful form of vision correction during these formative years.

- Eye Infection
- Refractive Errors
- Ocular Allergies
